H. BAER, M. D.
ELSINORE, CAL.

March 26, 1923.

Professor P. A. Munz,
Pomona College.

Dear Professor Munz:

Since seeing you, I have run across Erodium botrys again in the town of Perris, growing beside the railroad track. I have also found, that which I have long hunted for, Oligomeris glaucescens, just outside the limits of the town of Elsinore.

Also did I ran across Trichostema lanatum, for which I have also long hunted, and was surprised to find that it bloomed so early in the season, for its close kin blooms so late that I supposed this one was also a late bloomer. I found it at an altitude of 2500 feet on the Idyllwild grade, where it seems to be quite abundant, in which same locality I ran across Cheilanthes clevelandii, but found nothing else of interest, for below that level, everything is dried to a cinder, and above that level, it is too early for anything to be out.

Now another question, entirely foreign to the subject of botany. I am contemplating sending my daughter to a California college next term, merely that she will not be so far away from me, so have naturally thought of Pomona, and as I have to confess that I am not familiar with the college, I wish you would have the registrar send me the catalogue and what ever blanks they require to be filled out by the high school at which she graduated(if they wish those, for she will of course enter the sophomore class)

also what papers they wish filled out by the University where she now is.

Is it necessary to place applications early, that is to say are you crowded, also is it necessary to arrange about space in the dormitory early in the season in order to be certain of obtaining a room next fall.

I confess that I have not broached the matter to her, but one year in a cold climate was all that I was anxious for her to have, and from now on, I should prefer to have her a little closer, without the entire continent between us.

Trusting that you will be up again in the near future, I am,

Sincerely yours,

H Baer.
